

ABSTRACT OF THE DISCLOSURE

A server that is accessed from a plurality of groups excludes the influence of other groups, resulting in high-speed processing. When a predetermined user has logged in, a group specifying section specifies a group to which the user belongs. A using environment specifying section specifies a using environment corresponding to a group specified by the group specifying section. A using environment setting section sets an environment which conforms to a using environment specified by the using environment specifying section. To be concrete, an environment is set so that a DB corresponding to the user who has logged in is accessed. A processing section performs a process corresponding to a request from a user in an environment set by the using environment setting section.
